The Econometrics of Panel Data will be welcomed by econometricians and economists as a central reference point and guide to current thinking. The first volume features work on variance components model, its extensions and applications, estimation of variances, dynamic models, instrumental variable estimators and random coefficient models.

~~THE ECONOMETRICS OF PANEL DATA~~

Introduction. The aim of this volume is to provide a general overview of the econometrics of panel data, both from a theoretical and from an applied viewpoint. Since the pioneering papers by Edwin Kuh (1959), Yair Mundlak (1961), Irving Hoch (1962), and Pietro Balestra and Marc Nerlove (1966), the pooling of cross sections and time series data has become an increasingly popular way of quantifying economic relationships.

Panel data, also known as longitudinal data or cross-sectional time series data in some special cases, is data that is derived from a (usually small) number of observations over time on a (usually large) number of cross-sectional units like individuals, households, firms, or governments. In the disciplines of econometrics and statistics, panel data refers to multi-dimensional data

that generally involves measurements over some period of time.

~~What Is Panel Data in Economic Research?~~

In statistics and econometrics, panel data and longitudinal data are both multi-dimensional data involving measurements over time. Panel data is a subset of longitudinal data where observations are for the same subjects each time. Time series and cross-sectional data can be thought of as special cases of panel data that are in one dimension only (one panel member or individual for the former, one time point for the latter). A study that uses panel data is called a longitudinal study or panel study.

Panel data usually contain more degrees of freedom and more sample variability than cross-sectional data which may be viewed as a panel with $T = 1$, or time series data which is a panel with $N = 1$, hence improving the efficiency of econometric estimates (e.g. Hsiao et al., 1995). 4C. Hsiao

Application to panel data regression Let ϵ_{it} be the error term of a panel data regression model, with $i = 1, \dots, n$, and $t = 1, \dots, T$. Three different specifications are common: 1. $\text{Var}(\epsilon_{it}) = \sigma^2$ and all covariances between error terms are zero.
