An internal combustion engine (ICE) is a heat engine in which the combustion of a fuel occurs with an oxidizer (usually air) in a combustion chamber that is an integral part of the working fluid flow circuit.

Internal combustion engine - Wikipedia

Combustion, also known as burning, is the basic chemical process of releasing energy from a fuel and air mixture. In an internal combustion engine (ICE), the ignition and combustion of the fuel occurs within the engine itself. The engine then partially converts the energy from the combustion to work. The engine consists of a fixed cylinder and a moving piston.

Internal Combustion Engine Basics | Department of Energy

Internal-combustion engine, any of a group of devices in which combustion's reactants (oxidizer and fuel) and products serve as the engine's working fluids. Work results from the hot gaseous combustion products acting on the engine's moving surfaces, such as the face of a piston, a turbine blade, or a nozzle.

Internal combustion engines or IC engines are extensively used in automobiles, locomotives, marine application, power generation etc. Here the working media is hot and high pressure products of combustion of air and gasoline/diesel fuel. The combustion occurs internally within a cylinder and hence the name.

Conclusion. As the name implies or suggests, the internal combustion engines (briefly written as I.C. Engine) are those engines in which the combustion of fuel takes place inside the engine cylinder. In other words, the internal combustion engines are those engines in which the combustion of fuel takes place inside the engine cylinder by a spark. These are petrol, diesel and gas engines.

Various scientists and engineers contributed to the development of internal combustion engines. In 1791, John Barber developed a turbine. In 1794 Thomas Mead patented a gas engine. Also in 1794 Robert Street patented an internal-combustion engine, which was also the first to use the liquid fuel and built an engine around that time. In 1798, John Stevens designed the first American internal combustion engine. In 1807, French engineers Nicéphore and Claude Niépce ran a prototype internal ...

It's called internal because the combustion of the air-fuel mixture occurs inside the engine, in a combustion chamber, and some of the burned gases are part of the new combustion cycle. Basically, an internal combustion engine transforms the thermal energy of the burning air-fuel mixture into mechanical energy.

[How an internal combustion engine works – x-engineer.org](#)

The internal combustion engine is a heat engine in which combustion occurs in a confined space called a combustion chamber. Combustion of a fuel creates high temperature / pressure gases, which are permitted to expand. The expanding gases are used to directly move a piston, turbine blades, rotor (s), or the engine itself thus doing useful work.

The purpose of a gasoline car engine is to convert gasoline into motion so that your car can move. Currently the easiest way to create motion from gasoline is to burn the gasoline inside an engine. Therefore, a car engine is an internal combustion engine — combustion takes place internally. Two things to note:

An engine that uses liquid fuel to create energy, such as an internal combustion engine, is basically a large air pump. Cool air is drawn in, mixed with the fuel of choice to create power, then expelled as hot exhaust gas afterward. The more efficiently this “air pump” of an engine breathes, the more efficiently it produces power.
